

# Model-Based Systems Engineering and Prescriptive Simulation

Edward Huang

Assistant Professor

Systems Engineering and Operations

Research Department

George Mason University

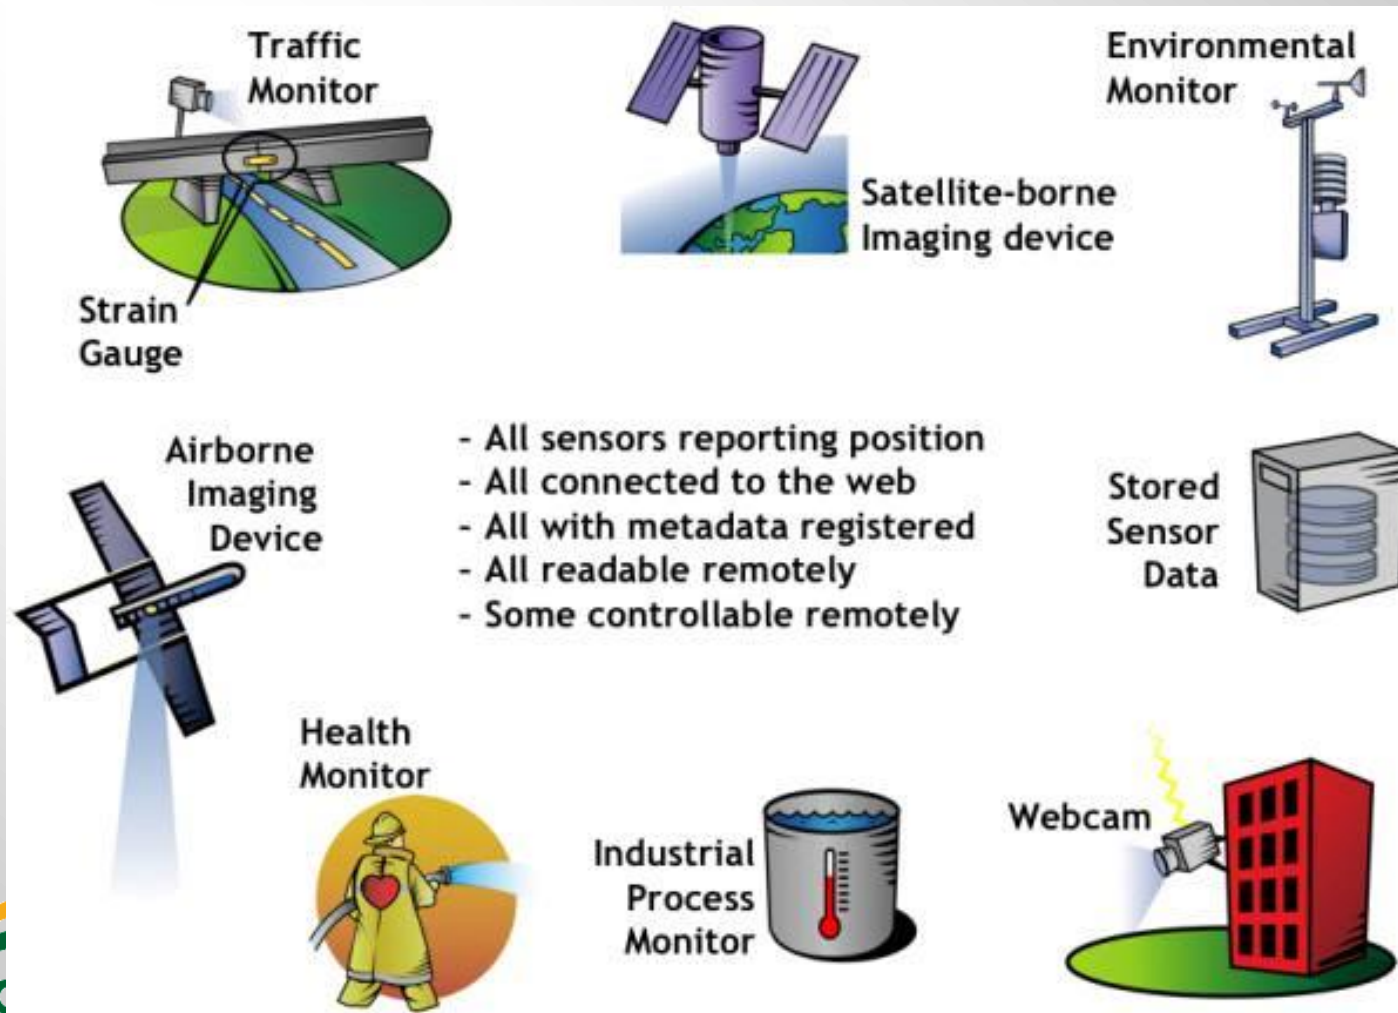

Where Innovation Is Tradition

# Agenda

- Architecture Challenge of Big Data
- Model-based Systems Engineering
- Prescriptive Simulation in Model-based System Engineering

# Big Data Challenge

# Big Data Challenge

Google's self-driving cars gather nearly 1GB of sensor data every second -- would you trust them?

# Challenges

1. How do we architect this system?
2. How do we make decisions under the big-data environment?
  - Quickly
  - Accurately

# How do we architecture the system for Big Data?

# Model-based Systems Engineering

Model-based systems engineering (MBSE) is the formalized application of modeling to support systems requirements, design, analysis, verification and validation activities beginning in the conceptual design phase and continuing throughout development and later life cycle phases.

(Source: INCOSE Systems Engineering Vision, 2007)

# SysML

SysML is designed to provide simple but powerful constructs for modeling a wide range of systems engineering problems.

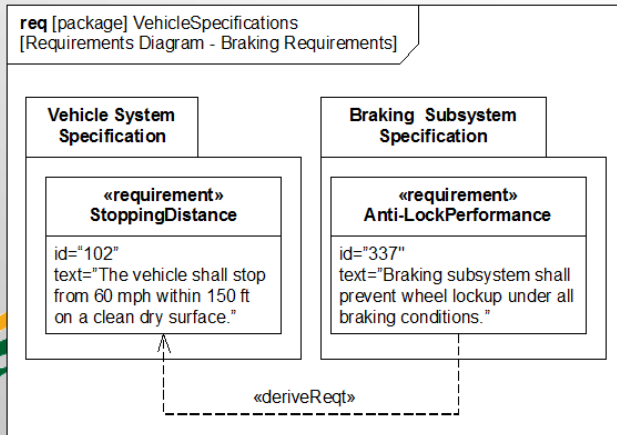

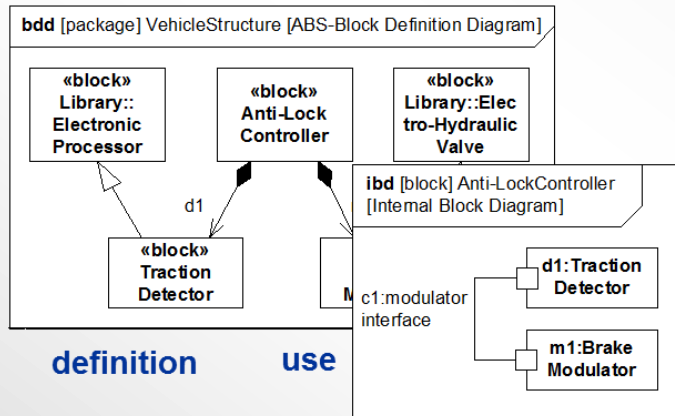

It is particularly effective in specifying requirements, structure, behavior, allocations, and constraints on system properties to support engineering analysis.

(Source: OMG SysML Specification)

# SysML

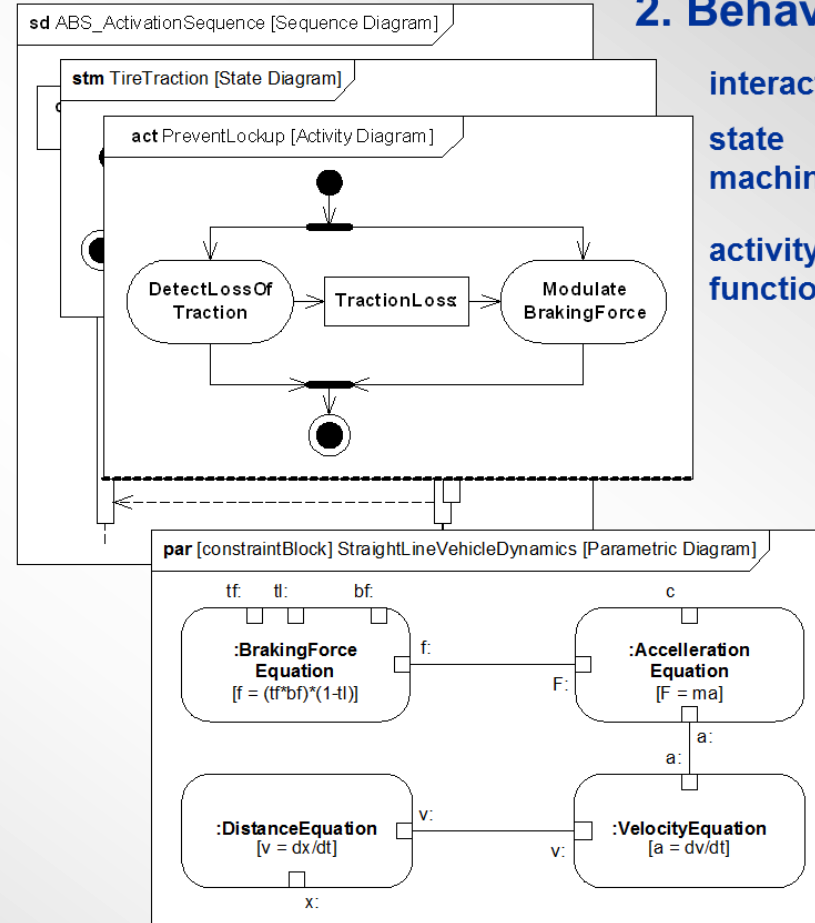

## OMG SysML™: Systems Modeling Language

### 1. Structure

### 4. Requirements

### 2. Behavior

### 3. Parametrics

Where Innovation Is Tradition

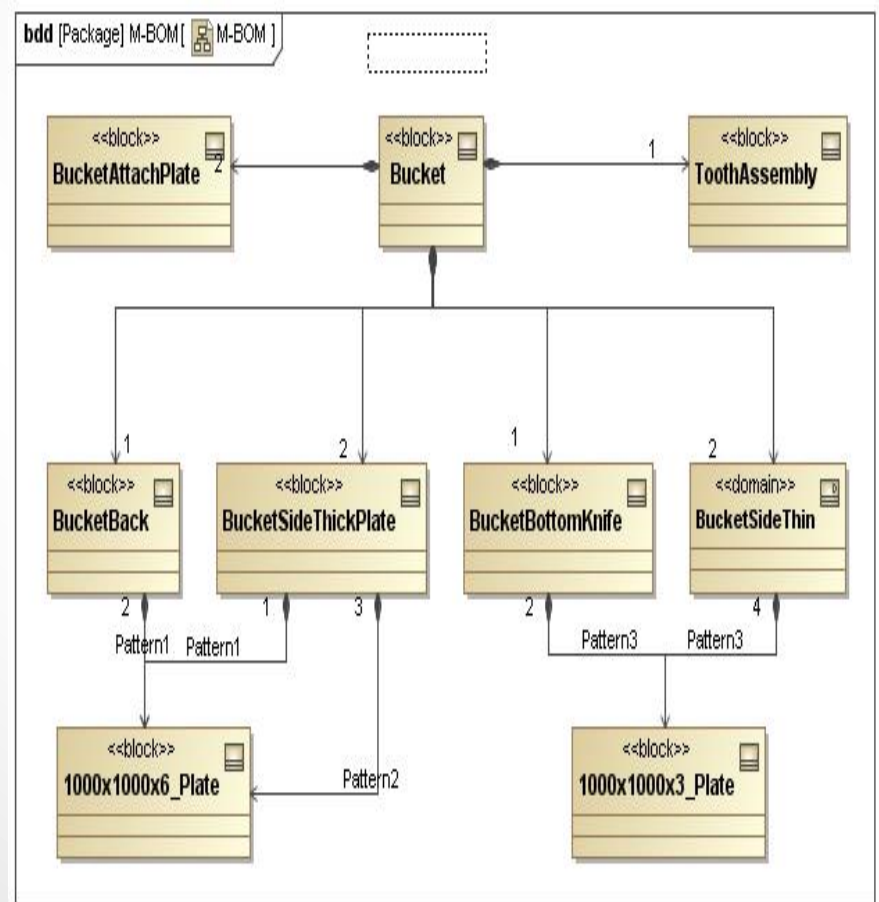

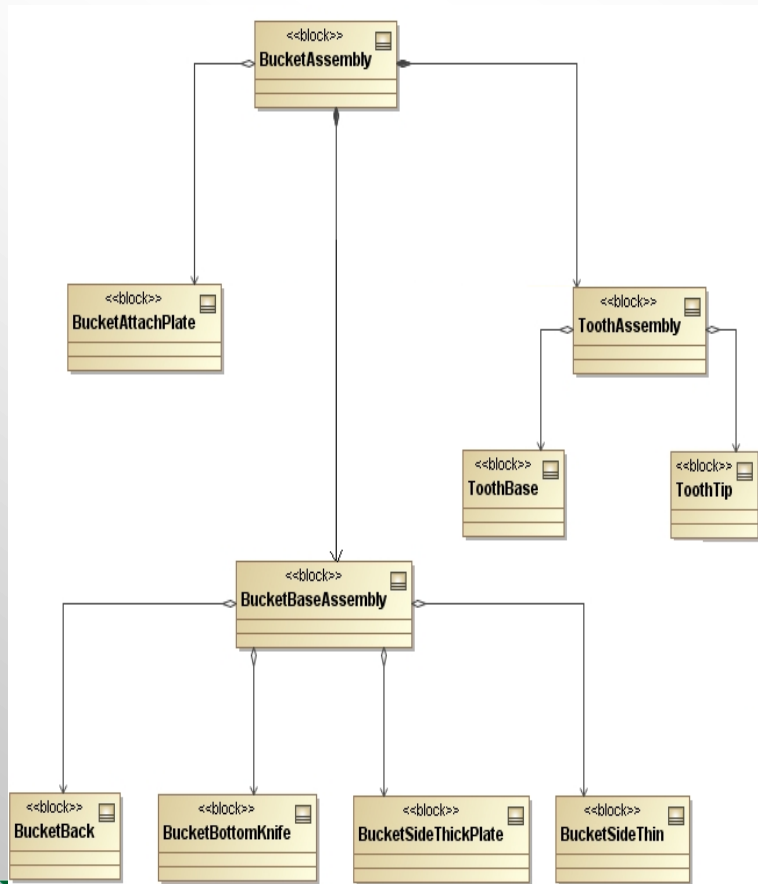

## 1. Structure

## 2. Behavior

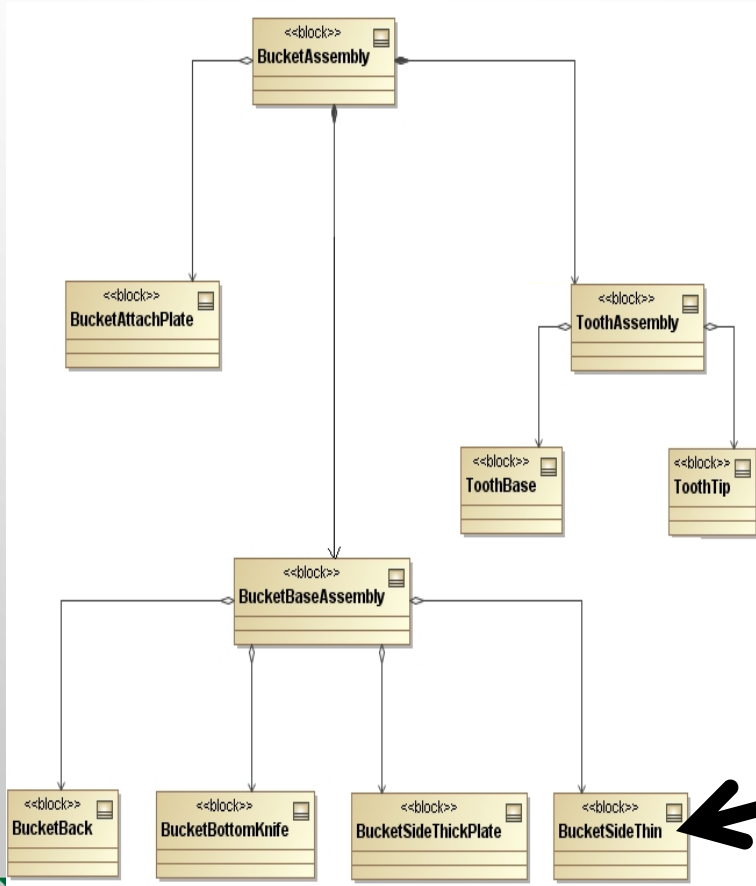

Key point: One model integrates all four aspects  
(and it can support execution/computation)

## 3. Parametrics

# Structure

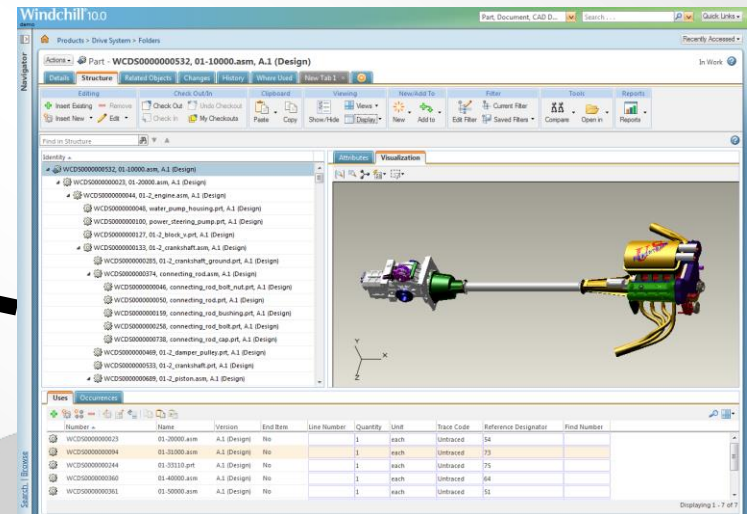

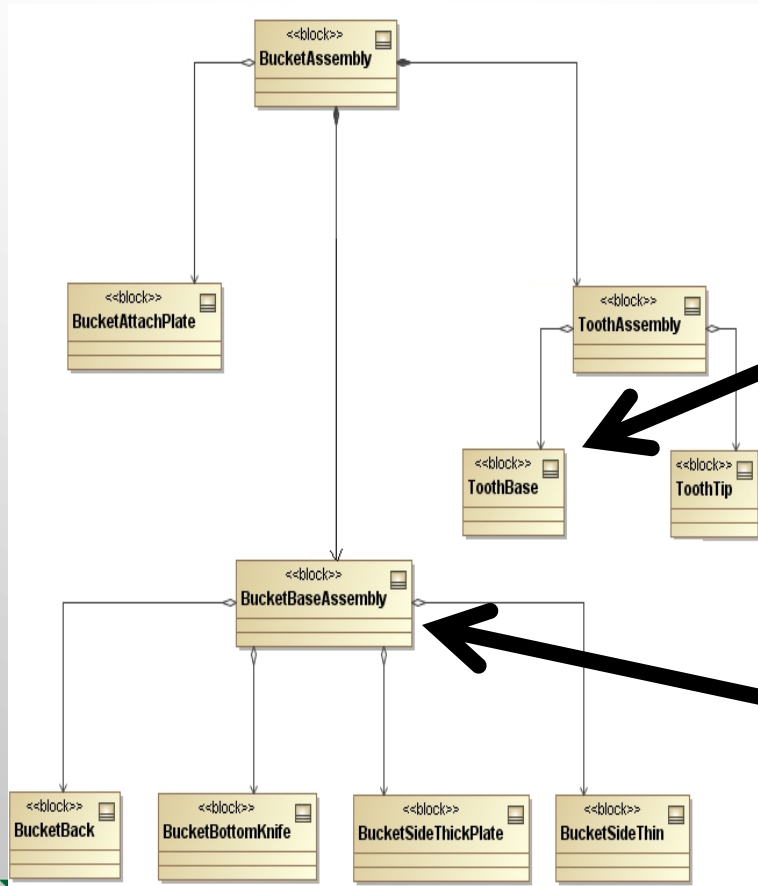

# Model of Data Integration

# Model of Data Integration

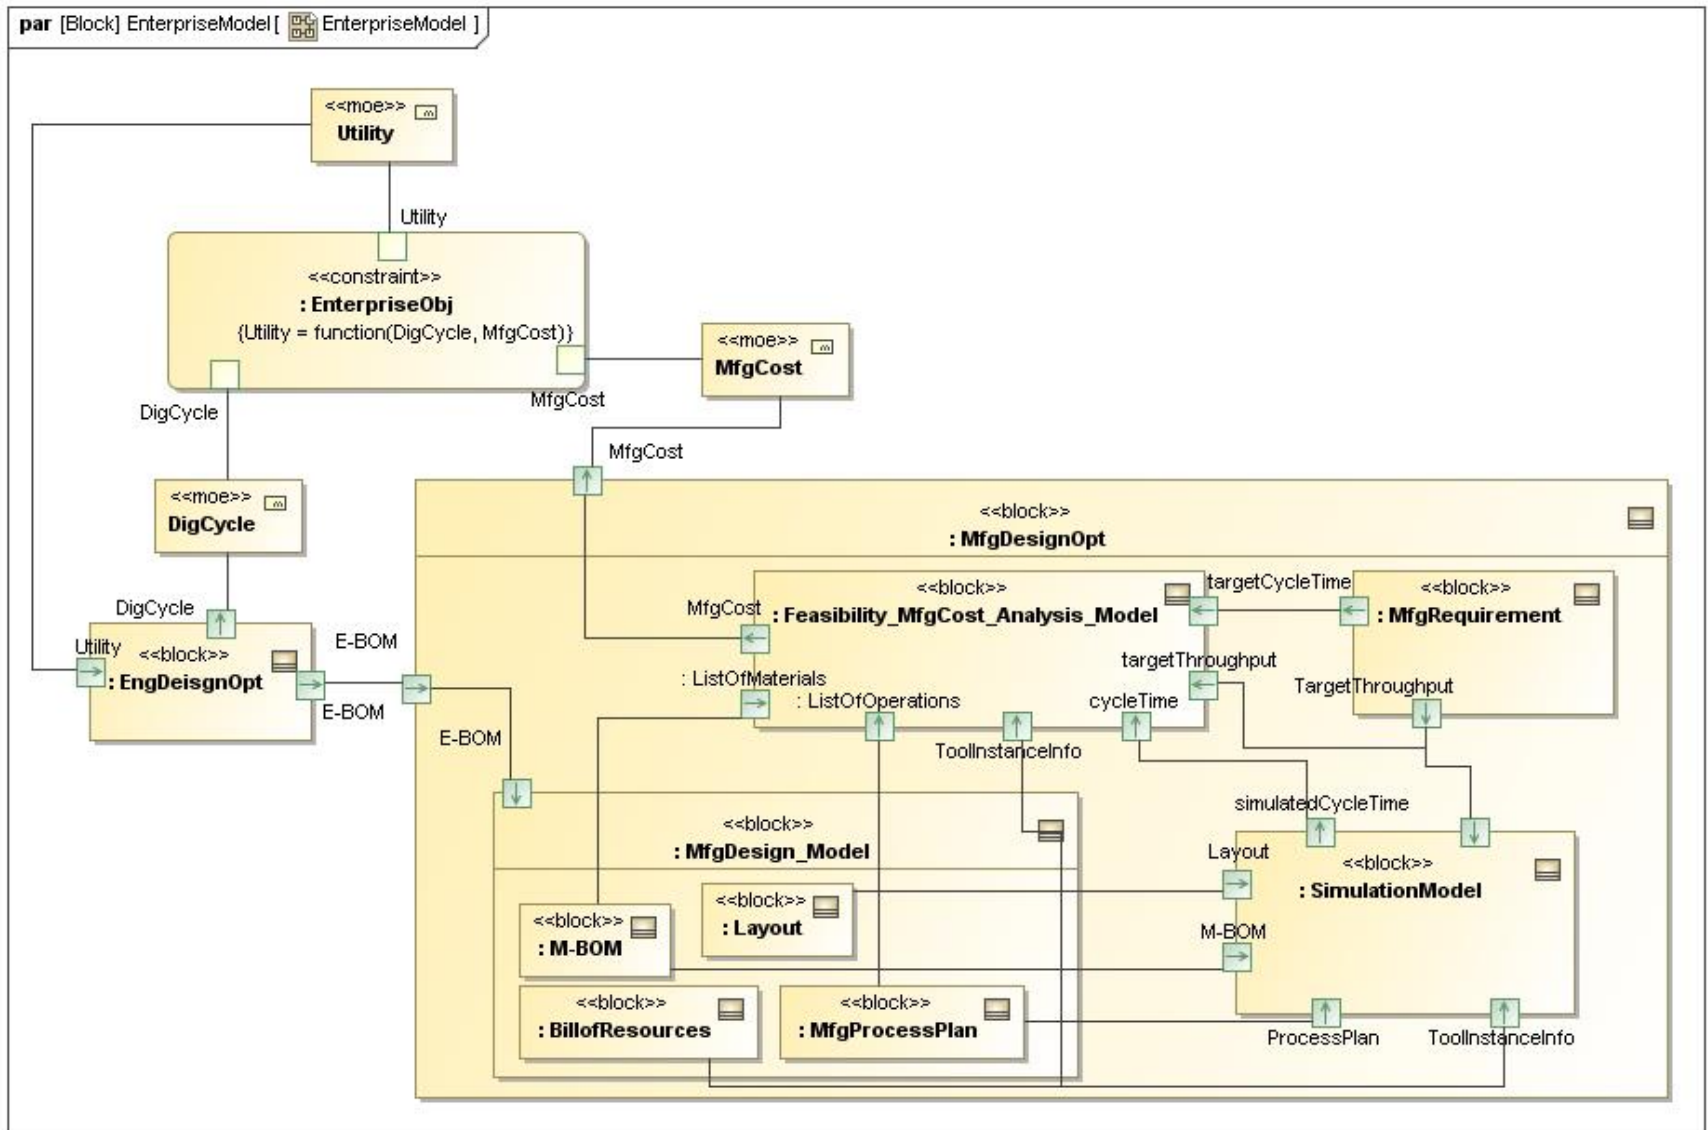

# Behavior

# Function Relationship

# How do we analyze using simulation?

# Demo

SysML model (using MagicDraw as authoring tools) to the discrete-event simulation model (AnyLogic).

# Model Transformation

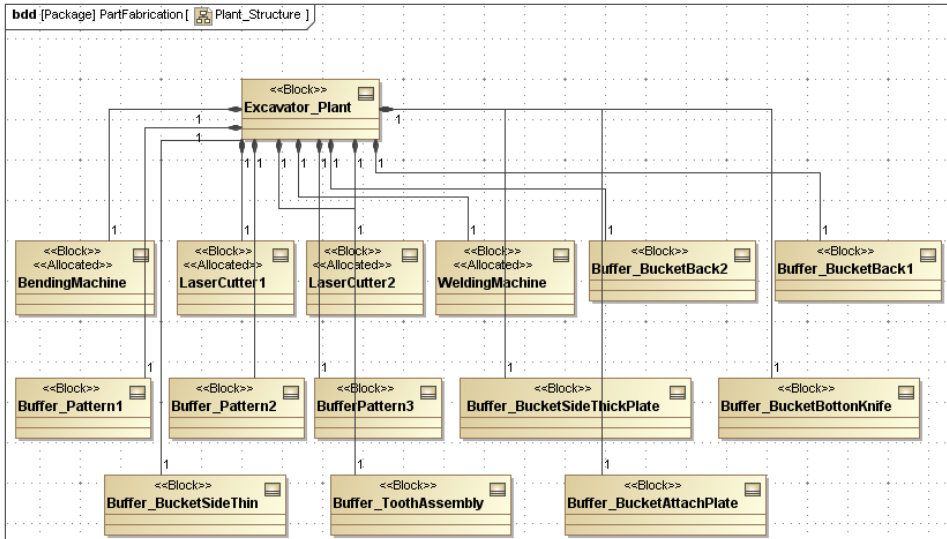

No need to learn a specific simulation language.

No need to know the transformation. The transformation algorithm is built based on meta-models.

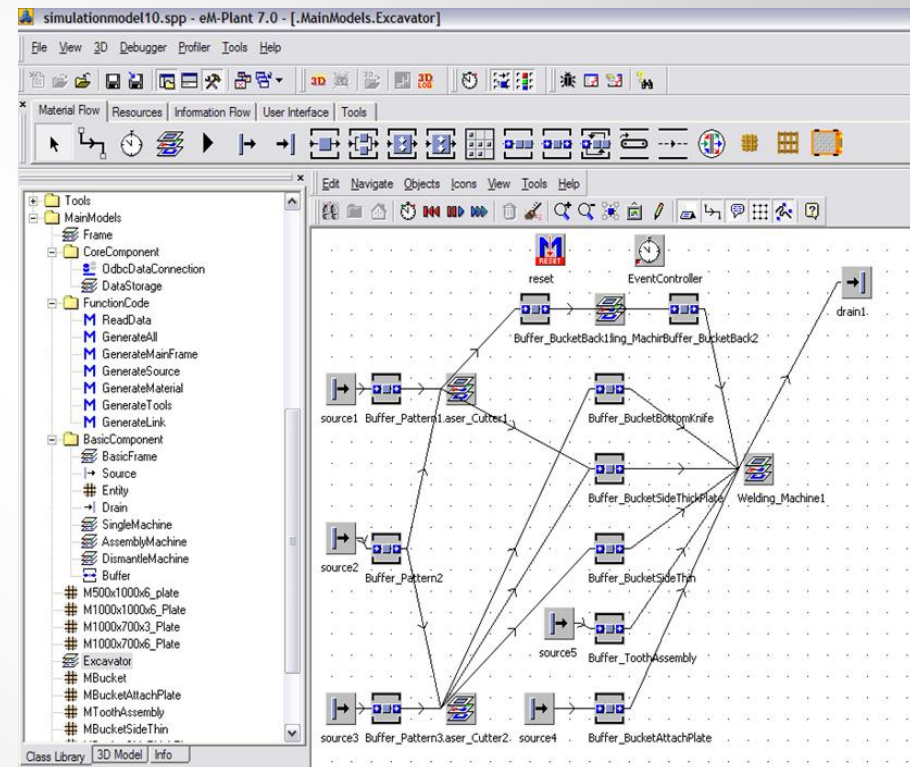

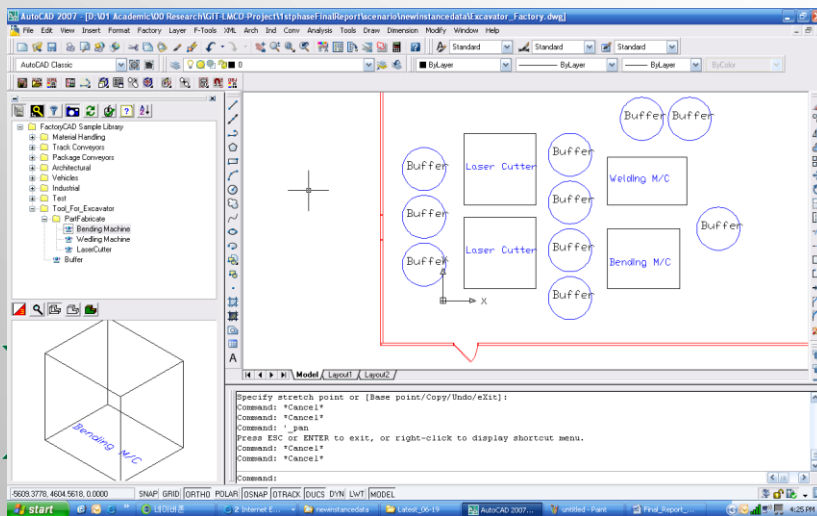

System structure and behavior are both transformed.

No stereotype is required.

# Simulation Generator--Structure

# Simulation Generator--Behavior

+

=

# Summary

1. SysML provides a formal approach to architecture system structure, behavior, requirements and the corresponding data.
2. The model transformation technology enables a SysML model to transform to the corresponding simulation model.
